

POWDER COATING SOLUTIONS

BY

SpaceGuard Products

Pretreatment Wash

A three-step process to remove any extra dirt and debris - a wash, a rinse, and a final rinse. This process etches the material as it cleans.

Go Green

Using zirconium as an alternative to phosphate saves on testing, toxic waste, and prevents flash rust.

Product Testing

At SpaceGuard, we perform four different tests on our finished product: the cross-hatch test, the MEK test, the peel test, and the impact test.

SpaceGuard Way

Our process is safe for the environment, allows us to pass savings from natural gas and water onto our customers and produces a coating that won't flake, chip, or rust.

Service Offerings

Our powder line can accommodate metal substrates up to 5' w x 2' h x 216" l, while our batch powder booth can accommodate small volume or large products up to 24' l.
