

# Pallet Rack Doors Vs. Pallet Rack Netting

*Automotive Company*

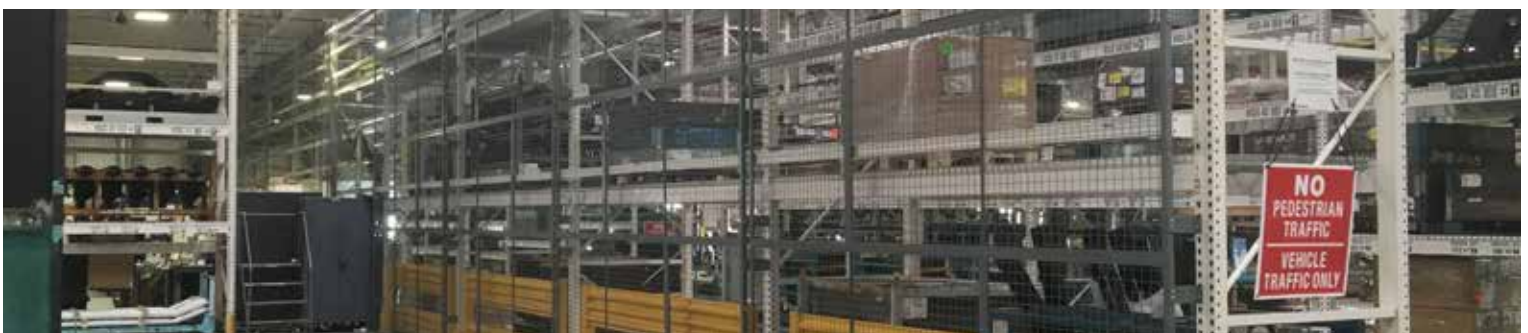

## Overview

One US automotive company learned the hard way a cheaper alternative to safety isn't always the best solution. They thought by installing a mesh netting solution along the pallet rack uprights, they had made a safe decision for their employees and their products. Unfortunately, this wasn't the case for this company.

## Challenge

It was a normal workday and the employee was just doing what he always does—added a pallet to a warehouse rack. But, on this day he mistakenly pushed the pallet too far and it tipped off the rear beam.

The security netting did hold the pallet for a short time, but with the weight of the pallet and the force put on the mesh netting it stretched too far. The pallet landed on the desk behind the row of pallet rack uprights. Thankfully, no one was sitting at the desk at the time. But the accident could've been very costly.

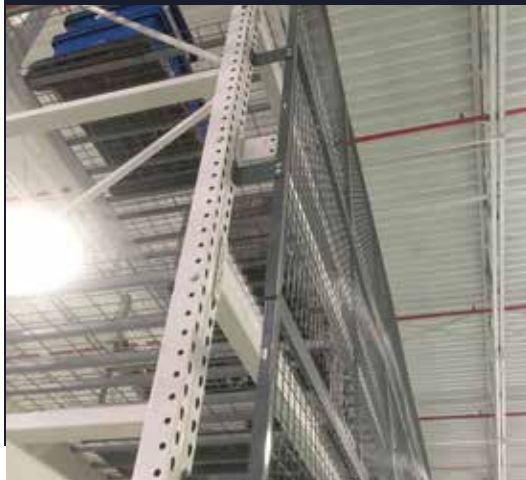

“The BeastWire product line was not only easy to install but the workers in that area feel a lot more comfortable working with a solid barrier between them and moving products just feet away. Thank you again for your partnership!” –Seth Landis, General Operations Manager, Eastern Lift Truck

## Conclusion

When security and protection are of the highest importance, you can count on [SpaceGuard Products](#) to provide an exceptional product—[BeastWire Mesh Pallet Rack Safety Panels](#). Because the wire mesh panels were easy to install, Eastern Lift Truck got the area operational in a timely manner. And, the employees felt safer knowing BeastWire was there to protect them.

## Solution

The automotive company immediately reached out to Eastern Lift Truck, a SpaceGuard Products dealer, to address the crisis at hand and work to get the area opened back up quickly. Time was money!

Due to their variety of pallet rack heights and products, Eastern Lift Truck decided on BeastWire Warehouse Rack Safety Panels as a solution to prevent an incident like this from happening in the future.

BeastWire mesh panels are constructed of 10-gauge or heavier-duty 6-gauge wire welded in a 2” square mesh pattern and welded securely into a 1-1/4” x 1/8” thick full angle frame—providing the ultimate strength and durability. They attach to the existing pallet rack uprights with either the patent-pending *Grrripper* Bracket or the innovative L-shaped or Sleeve brackets.

The BeastWire *Grrripper* Bracket (patent-pending) is the world’s first and only drop-in bracket. The pin drops into a tear-drop rack upright and it won’t disengage upon impact when it’s installed correctly. The *Grrripper* Bracket makes installation easy saving on time and money.

BeastWire Warehouse Rack Safety Guarding Panels are preferred over most nylon mesh netting. The wire mesh panels provide a definite stop to keep pallet loads or stray boxes from falling into pedestrian aiseways, like what happened to this customer.

Unlike plastic netting or nylon mesh netting—which are flexible by nature, BeastWire’s welded wire mesh design, won’t allow sharp objects to damage or cut through the wire providing a more secure guarding option.
